Overview: This course provides an introduction to linguistic anthropology, the study of the relation between language and culture. As a discipline, linguistic anthropology is at the intersection of cultural anthropology and linguistics. Linguistic anthropologists seek to understand language as an integral part of culture - the sum total of the knowledge and practices (socially shared habitual behavior) that an individual partakes in by virtue of being a member of a community. This perspective makes it possible for linguistic anthropologists to use linguistic evidence and methods of linguistics to illuminate the culture of the speech community and to bring cultural evidence and anthropological methods to bear on the study of those aspects of language that are culture-specific. Such culture-dependent traits pervade every part of language, from phonology and phonetics through morphology and syntax to semantics and pragmatics.

Linguistic anthropology has developed two broad themes, each branching off into numerous different lines of inquiry. Cognitive anthropology focuses on the meanings expressed by the lexical items and grammatical constructions of a language, asking to what extent these reflect culture-specific conceptualizations of the speech community. For example, ethnomotanists and ethnozoologists study indigenous terminologies for life forms, seeking to determine what aspects of these vary from community to community, depending on the particular use of and significance attributed to a life form, and what aspects are shared across cultures, reflecting the shared biological and cognitive heritage of humankind. Similar research has targeted terminologies for color, kinship, emotions, tastes and smells, and so on. The most controversial idea in cognitive anthropology is the Linguistic Relativity Hypothesis - the hypothesis that the language habitually used by the members of a community may influence the way they memorize and conceptualize reality. The ethnography of speaking (or ethnography of communication), the other major sub-field within linguistic anthropology, examines culture-specific aspects of language use, viewing speaking itself as a cultural practice - from simple speech acts such as greetings and leave-takings via more complex “scripted” speech events (e.g., religious ceremonies, political speeches, court room proceedings) to the ethno-poetic study of verbal art and to culture-specifics norms of linguistic politeness.

Goals: The course aims to familiarize students with some of the key ideas, methods, approaches, and findings within linguistic anthropology. At the end of this course, students should have a working understanding of these issues that is sufficient to allow them to determine, when confronted with a phenomenon in their future academic or non-academic practice, the basic questions a linguistic anthropologist might ask about this phenomenon and where to look for existing research that might have addressed the phenomenon. The general learning goal for this course is to properly understand the
central ideas of linguistic anthropology. A partial list of the ideas discussed in the course is provided in the Appendix.

Classes: M/W 4:00-5:20pm in 110 Knox
Instructor: Dr. Jürgen Bohnemeyer – Office 642 Baldy Phone 645-0127
E-mail jb77@buffalo.edu Office hours M 3:00 – 3:50pm / F 2:00 – 3:00pm

Coursework:

• Reading assignments and reading comprehension questions - there’ll be a reading assignment from the textbook and/or primary sources in preparation of each class. Students are encouraged to post questions about the readings on the UBlearns blog. The questions must concern the content of the particular reading, must be specific (“What is this chapter/p234/the third paragraph about?” doesn’t fly), and they must be genuine questions the student has when trying to understand the particular reading and thinking about the implications of the points made there. Good, valid questions will be answered on the blog. **Both the number and the quality (in terms of thoughtfulness/incisiveness) of the questions submitted count towards the participation grade.**

• In-class participation. I grade participation as follows: Regular active participation – A; regular attendance and occasional active participation – B; regular attendance, no active participation – C; irregular attendance, no active participation: D; poor attendance, no active participation: F. **Attendance will be taken at the beginning of every lecture.** Attendance counts as irregular if the student missed more than one lecture unexcused and as poor if more than three lectures were missed unexcused.

• Three multi-week projects, each to be completed in multiple stages. The stages constitute separate homework assignments and will be submitted and graded as such. There will be eight such assignments altogether. The first project involves the analysis of an American English discourse. For the second and third assignments, students collect and analyze data from a language other than their native language. The first project involves two stages, the remaining two projects three stages each. Students are given one week for the completion of each stage. The projects as a whole will be graded, the individual stages not.

• A take-home final exam, consisting of a set of questions to be answered in single-paragraph essays (e.g., “What generalizations emerged from Berlin & Kay’s 1969 study of Basic Color Terms”?). The exam will be assigned in the final week of classes and must be completed within two weeks. Students may elect to write a short (maximally 10 pages) term paper in lieu of the final exam. The topic of the paper must be accepted by the instructor at least three weeks in advance of submission.

• Lit review presentations: Students may present a summary and discussion of one of the primary readings on the syllabus in class during the lecture for which the reading is listed. Presentations should be 10-20 minutes long and must be accompanied by a handout. Undergraduates may do a lit review presentation in
lieu of the final exam; grad students may do one to improve their assignment grade.

**Assessment:** Participation (determined by attendance, in-class participation, and the reading comprehension questions the student posted), each of the three homework project, and the final exam each count for 20% of the final grade.

**Learning outcomes:** The following table identifies the intended learning goals of the course and maps them to the instruments that will be used for the assessment of the students’ success. *Keep in mind, however, that all of these assessment instruments are designed not only to test attainment of the learning goals, but simultaneously also to solidify, enhance, and refine them.*

<td></td>
</tr>
<tr>
<td></td>
<td>3 (HW #8)</td>
<td>Learn to conduct an analysis of the lexical meaning and underlying conceptual categories lexicalized in the kinship terms you collected during the first stage and to typologically classify the kinship term system.</td>
<td></td>
</tr>
</tbody>
</table>

**Final Exam**

Develop an awareness for key research questions and debates (see Appendix) within the field of Linguistic Anthropology and learn how key landmark studies have contributed to these debates.

---

**Paperless Class:** Lecture notes will be posted on UBlearns/Course Documents two hours ahead of class. Additional readings will be posted on UBlearns/Course Documents two days ahead of class. Homework projects will be posted on UBlearns/Assignments. Students upload the stages of the project to UBlearns/Assignment Tool. Accepted formats: MS Word doc and PDF. Be sure to click on “Send”, not on “Save”, to post! Annotated and graded assignments will be returned via UBlearns/Assignment Tool. The same holds for the final exam.

**Outline:** Unless otherwise noted, reading assignments refer to the textbook, Foley 1997. All other readings will be downloadable from UBlearns (*) or from the online course reserve site of the UB Libraries (^). Syntax of the reading assignments:

- \( a; b \) – read \( a \) and \( b \)
- \( a; (b) \) – read \( a \) plus optionally \( b \)
- \( a/b \) – read \( a \) or \( b \), depending on which one was selected for discussion in class (and read the other optionally in addition if you’re interested)

Appendix: Learning goals - Some of the central ideas of linguistic anthropology to be discussed during the course

• Both languages and cultures can be viewed from three complementary perspectives:
  o cognitively, in terms of (declarative or procedural) knowledge
  o semiotically, in terms of (systems of) signs and their interpretations
  o socially, in terms of conventions of social behavior or practices
• In each of these respects, the language(s) spoken by the members of a community emerge(s) as a part of the larger culture shared by this community
• Cultural knowledge is learned - as opposed to innate - knowledge. It is diffused in two ways:
  o through the observation of practices enacted by other members of the community
  o through the use of external representational systems such as language, gesture, and art
• As learned cultural knowledge is complementary to the innate knowledge stored in the human DNA, so cultural evolution has taken over from biological evolution in the development of humankind.
• Given the key role that language plays in the transfer of cultural knowledge, it has been hypothesized that language, culture, and the complex brain that enables humans to learn and use linguistic and cultural knowledge have co-evolved.
• It is an open question what aspects of cognition are innate, biologically determined, and what aspects are learned and culturally diffused. In other words, it is an open question where in the mind the dividing line between nature (biology) and nurture (culture) is. An important boundary condition on answers to this question is set by the extent to which cognition - e.g., memory, inferences, and similarity judgments - is influenced by language use. The possibility of such influences is claimed by the Linguistic Relativity Hypothesis (LRH).
• In the first half of the 20th Century, various authors proposed strong, deterministic versions of the LRH, according to which the categories and terms in which people think are (almost) exclusively those of their native language. Under this view, there is a strong influence from language onto internal cognition, but no influence from cognition onto language. Consequently, it is assumed that linguistic categorization varies from language to language “arbitrarily”, i.e., without non-trivial non-linguistic constraints. Historically, this view has been associated in particular with the work of Benjamin Lee Whorf.
• Through its lexical items and constructions, every language expresses a highly complex system of categorizations of reality. This includes categories of the natural world - categories for plants and animals, colors, emotions, kinship relations, and so on. These categories vary somewhat from language to language, reflecting in part differences in cultural significance (e.g., the same plant is
cultivated as a food resource in one culture, collected in the wild for medicinal use in another, and considered a weed in the third).

- Evidence for cognitively motivated universals in *ethnosemantics* - the linguistic categorization of the natural world - discourage the strong = deterministic version of the LRH. But a weaker, non-deterministic interpretation, according to which non-linguistic cognition exists and functions independently of language, but may nevertheless be influenced by it, is very much debated today.

- The use of language is highly culture-specific. Different cultures recognize different *speech events* - conventional, “scripted” activities in which language plays a constitutive role. These range from simple *speech acts* such as greetings and apologies via economical, political, and judicial transactions and religious or curing rituals to verbal art forms. They can be classified and compared across cultures in terms of, above all, the linguistic expressions and *registers* and the roles of the participants they involve.

- Languages, dialects, registers, and even particular lexical items and grammatical constructions acquire cultural meanings by indexical association with particular groups of people - defined in terms of class, ethnicity, gender, age, and so on - viewed as stereotypically using them. These indexical values in turn become the objects of attitudes both in the users of a particular variety or expression and in other members of the community. Speakers may choose a variety or expression and thereby identify themselves with the stereotypically associated group or choose an alternative and distance themselves from the stereotyped group. These choices constitute secondary indexical associations.

- One of the most important aspects of social interactions is the maintenance of the social ties between the participants. *Politeness* is the cover term for a myriad of linguistic and non-linguistic practices with this goal. The role of politeness is pervasive in all aspects of linguistic structure and language use. The strategies of showing respect and solidarity used in a language are sensitive to fine-grained distinctions in the cultural conceptualization of power and personhood.
