Location constructions in Yurakaré

'A dog is sitting behind a house.'

Location constructions in Yurakaré

'A dog is sitting next to a house.'

Observation #1

Different strategies available for the 'specifier'

- object based
- surface/shape/size dependent terms
- 'dedicated' terms
- meronyms

Object-based terms

aeskalera
'its ladder'

ajurushaw;
atimon

ajumë
'its tree, its
pole'

na mentisan
(ointment in pill box)

Surface-based terms

amürümürü
'its ribbed
surface'

alëbëlëbë 'its even
surface'

Shape-based terms

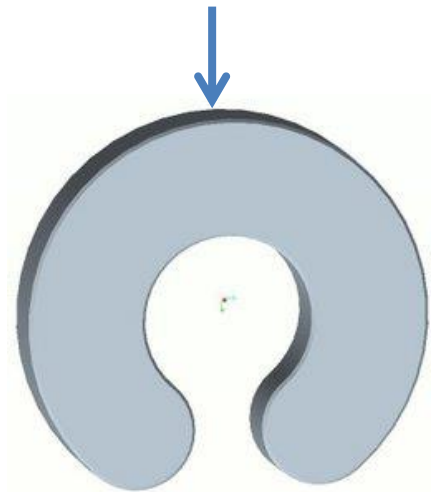

ajululita 'its round part'

apimpimta 'its cylindrical part'

aeskinanñu 'its little corner'

Size-based terms

dyindilë malati
'(the one) which is
thin'

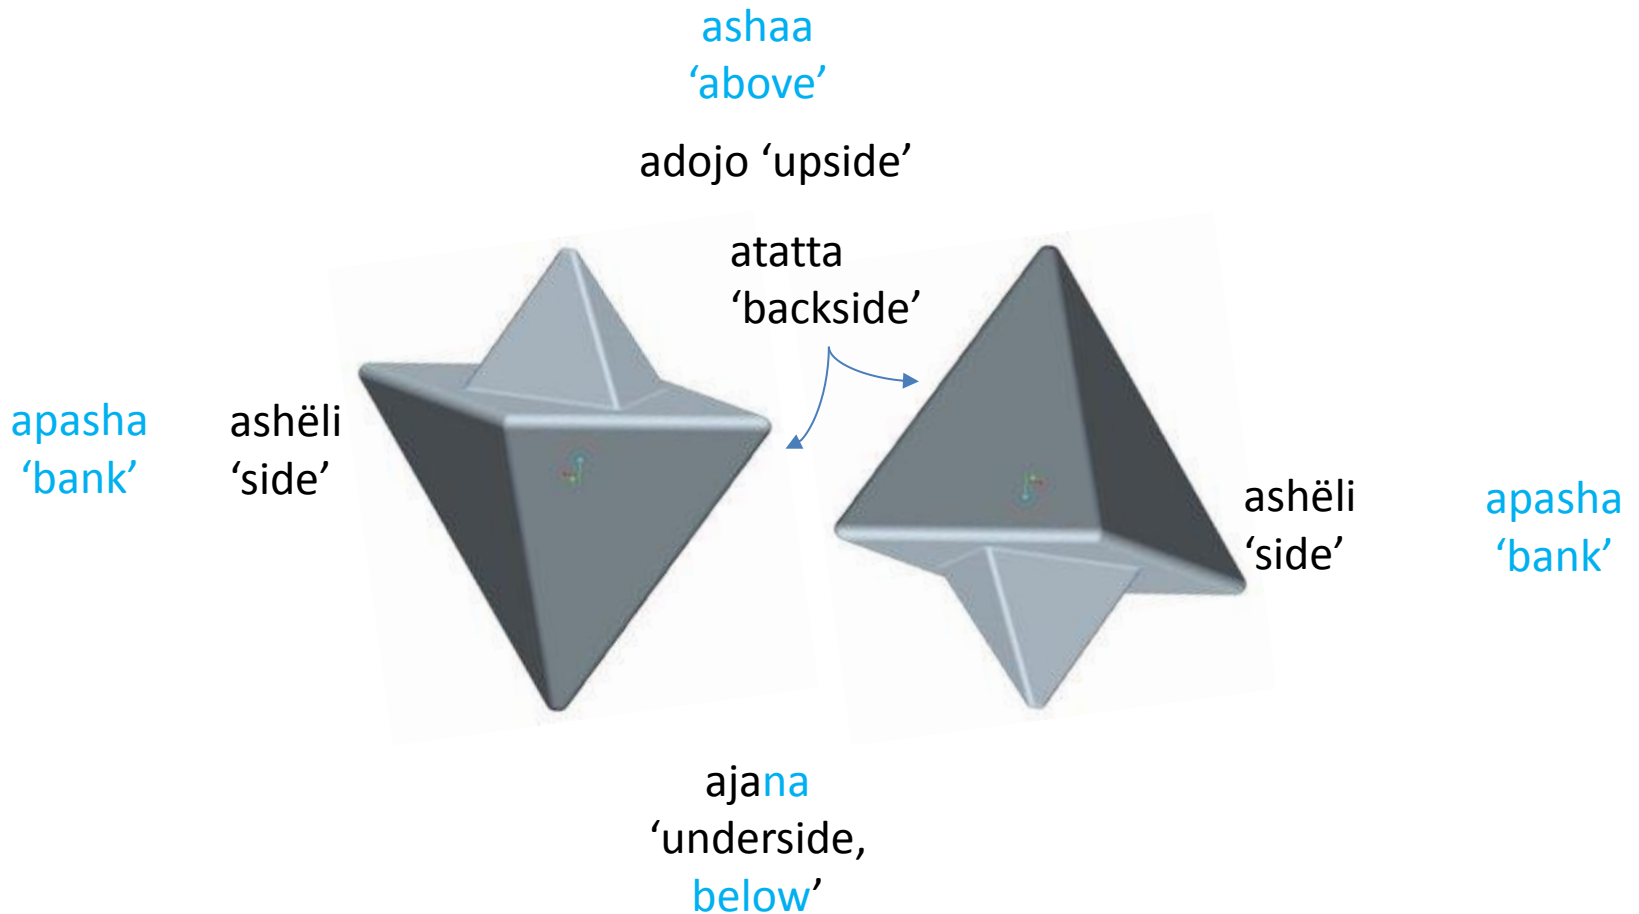

amatamalapshë
'its big one'

na tëchikkaja
'The long one'

Dedicated spatial vocabulary

Body-part meronyms

Observation #2

Not all strategies are equally frequently used. Meronyms are among the most frequently employed strategies in the test, with only dedicated vocabulary with a higher token-type ratio.

Frequency (token) counts of meronyms mentioned in the object parts test
 relative frequency of meronyms compared to other strategies

	Types (N=96)	Tokens (N=434)	Freq. factor
Meronyms	35	197	5.6
Non-meronyms	61	237	3.9

	Types	Tokens	Freq. factor
Dedicated	7	80	11.4
Meronyms	35	197	5.6
Shape	17	81	4.8
Size	5	19	3.8
Surface	9	25	2.8
Object	17	25	1.5
Other	6	7	1.2

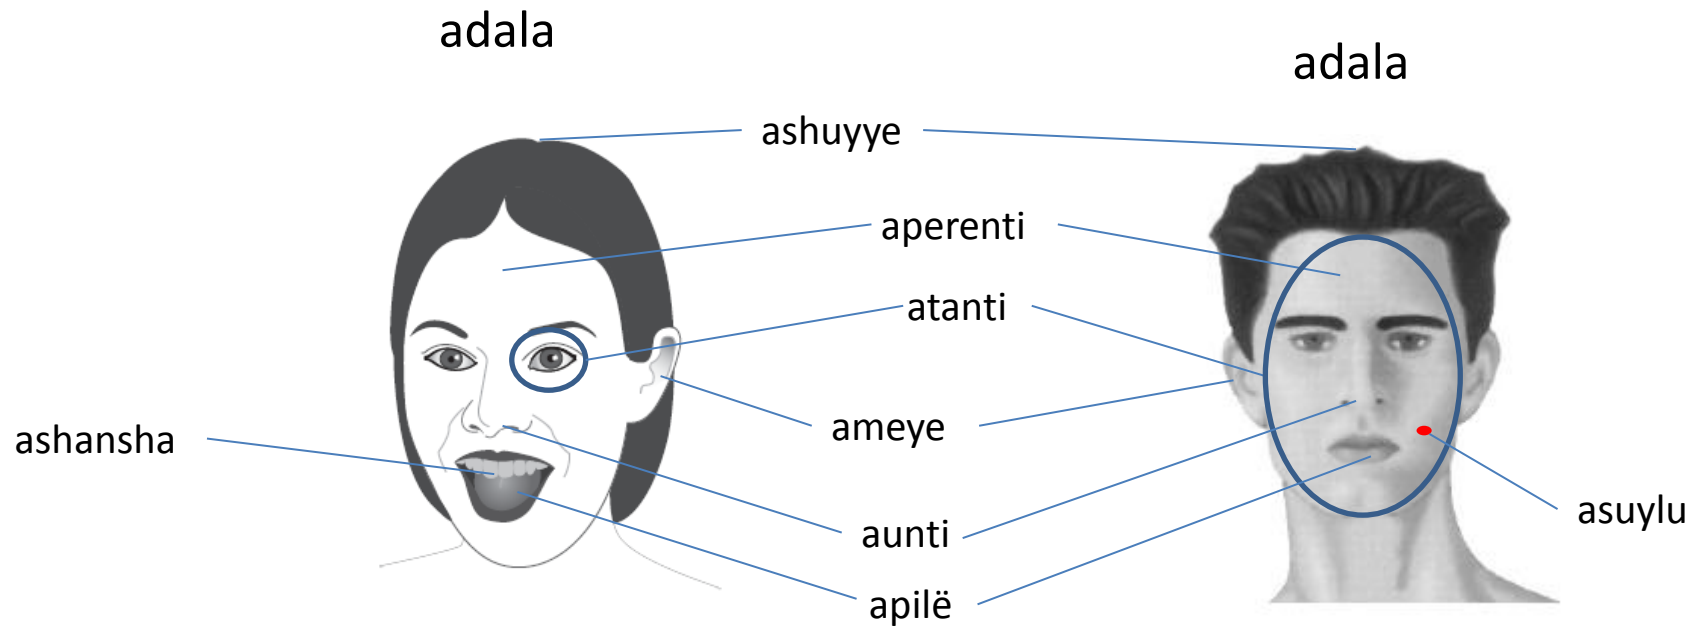

Observation #3

The human body is certainly the most important source for meronyms, but not the only one. Animal body parts and plant parts are also used.

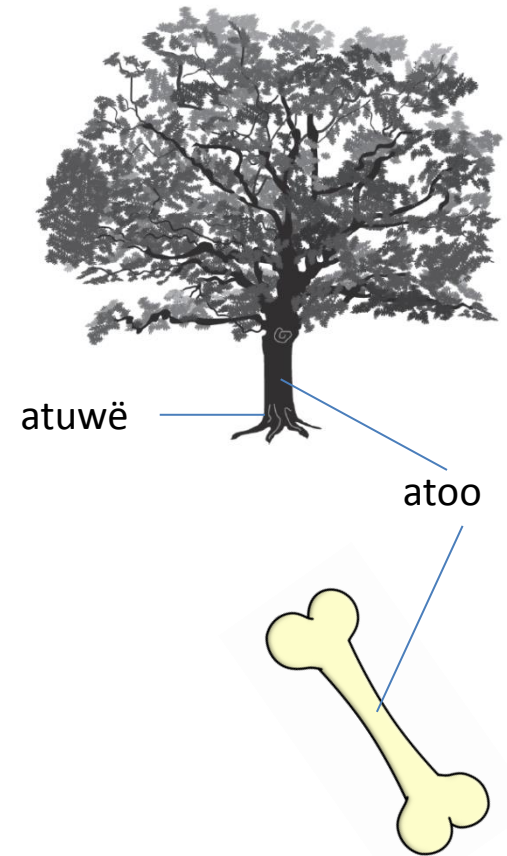

Body-part meronyms mentioned in the locations test

Body-part meronyms mentioned in the locations test (head)

Body-part meronyms mentioned in the locations test (animals and trees)

Observation #4

There is a skewing in the use of meronyms, favoring certain meronyms over others.

Frequency counts of meronyms mentioned in the object parts test
frequency of individual meronyms (top 5)

1	Unti 'nose'	28
2	Shuyye 'crown'	25
3	Pojye 'horn, antler'	20
4	Sopto 'belly'	13
5	Tewwe 'foot'	12

Frequency of
meronyms

Observation #5

There may be a Levinsonian main axis-finding protocol, but directionality assessment seems at best a tendency (though more data are necessary).

Referents of *unti* 'nose'

Referents of *shuyye* 'crown'

Referents of *pojye* 'horn'

Referents of *sopto* 'belly'

Referents of *tewwe* 'foot'

Meronyms in Yurakaré

How are axes determined?

Levinsionian algorithm

1. main axis = creates generalized cone w/largest volume (\approx longest axis)
2. top = end w/sharpest convexity; bottom = 'squashed' end
3. orthogonal axis = yields two paired symmetrical halves
4. front = flatter and/or less complex surface

Meronyms in Yurakaré

top

bottom

unti 'nose'

shuyye 'crown'

pojye 'horn'

tewwe 'foot'

sopto 'belly'

Meronyms in Yurakaré

unti 'nose'

shuyye 'crown'

pojye 'horn'

tewwe 'foot'

sopto 'belly'

Meronyms in Yurakaré

adyulta 'its back'

against Levinson's orthogonal axis procedure

Observation #6

Meronym assignment in Yurakaré depends at least on

1) object orientation

2) shape

3) A main versus secondary body dichotomy

>> possibilities of multiple occurrences only for secondary bodies

Meronyms in Yurakaré

	unti	shuyye	pojye	sopto	tewwe
orientation	front/top (?)	top	top	center	bottom
shape	(apex of) sharp convex	flat or mildly tapering convex	long protrusion	round?	Small (roundish?) protrusion
size	secondary body	neutral	secondary body	main body	secondary body
occurrences	multiple	single	multiple	single?	multiple

Meronyms in Yurakaré, some other terms

	awishwi	asoporo	adyulta	adyukku	abanaw
orientation	back	side of 3D	back	bottom or back	middle
shape	protrusion	either flat or convex	relatively flat surface	flat or convex	protrusion
size	secondary body	main body	main body	main body	secondary body
occurrences	?	single	single	single	multiple

Observation #7

We can construct a main body rudimentary frame based on meronyms a la MacLaury.

However, a) not all terms in the system are derived from the human body and b) there is no fixed human (standing) orientation.

Meronyms in Yurakaré

Meronyms in Yurakaré

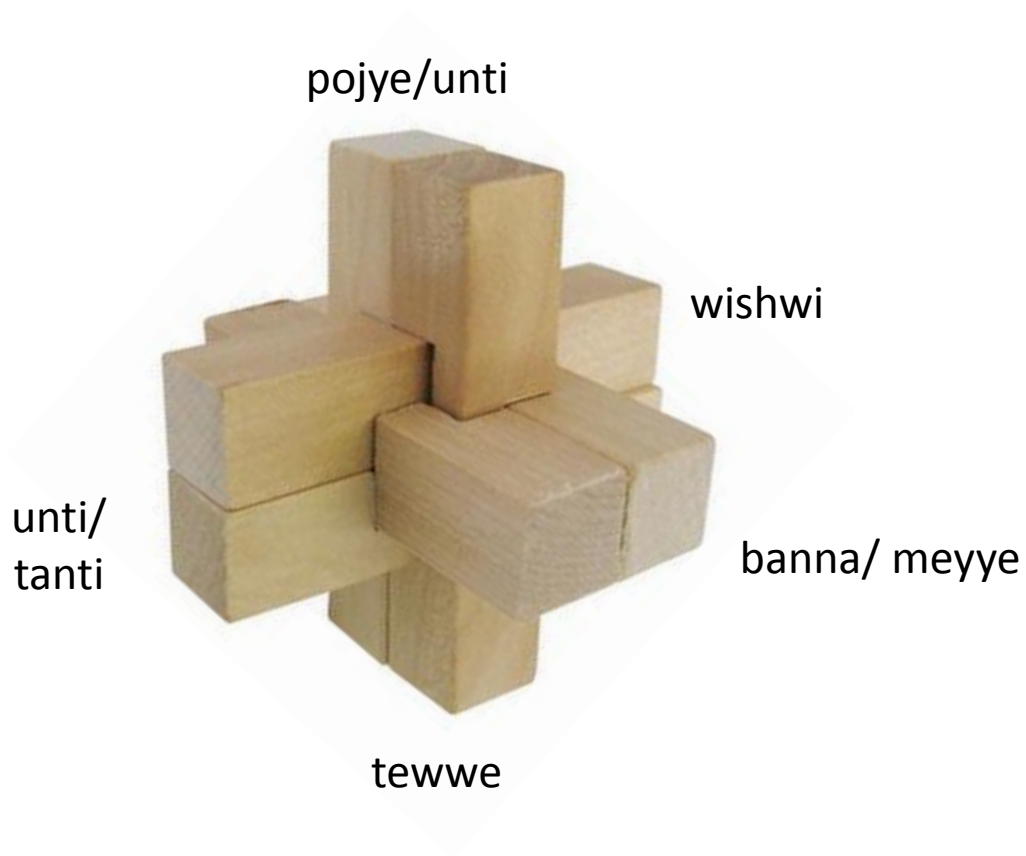

Meronyms in Yurakaré

Observation #8

There also seems to be a protrusion-based frame (also relative to orientation)

Conclusions

Meronym assignment in Yurakaré is a relatively flexible, system operating on at least the following parameters

- object orientation
- shape
- surface
- size

Conclusions

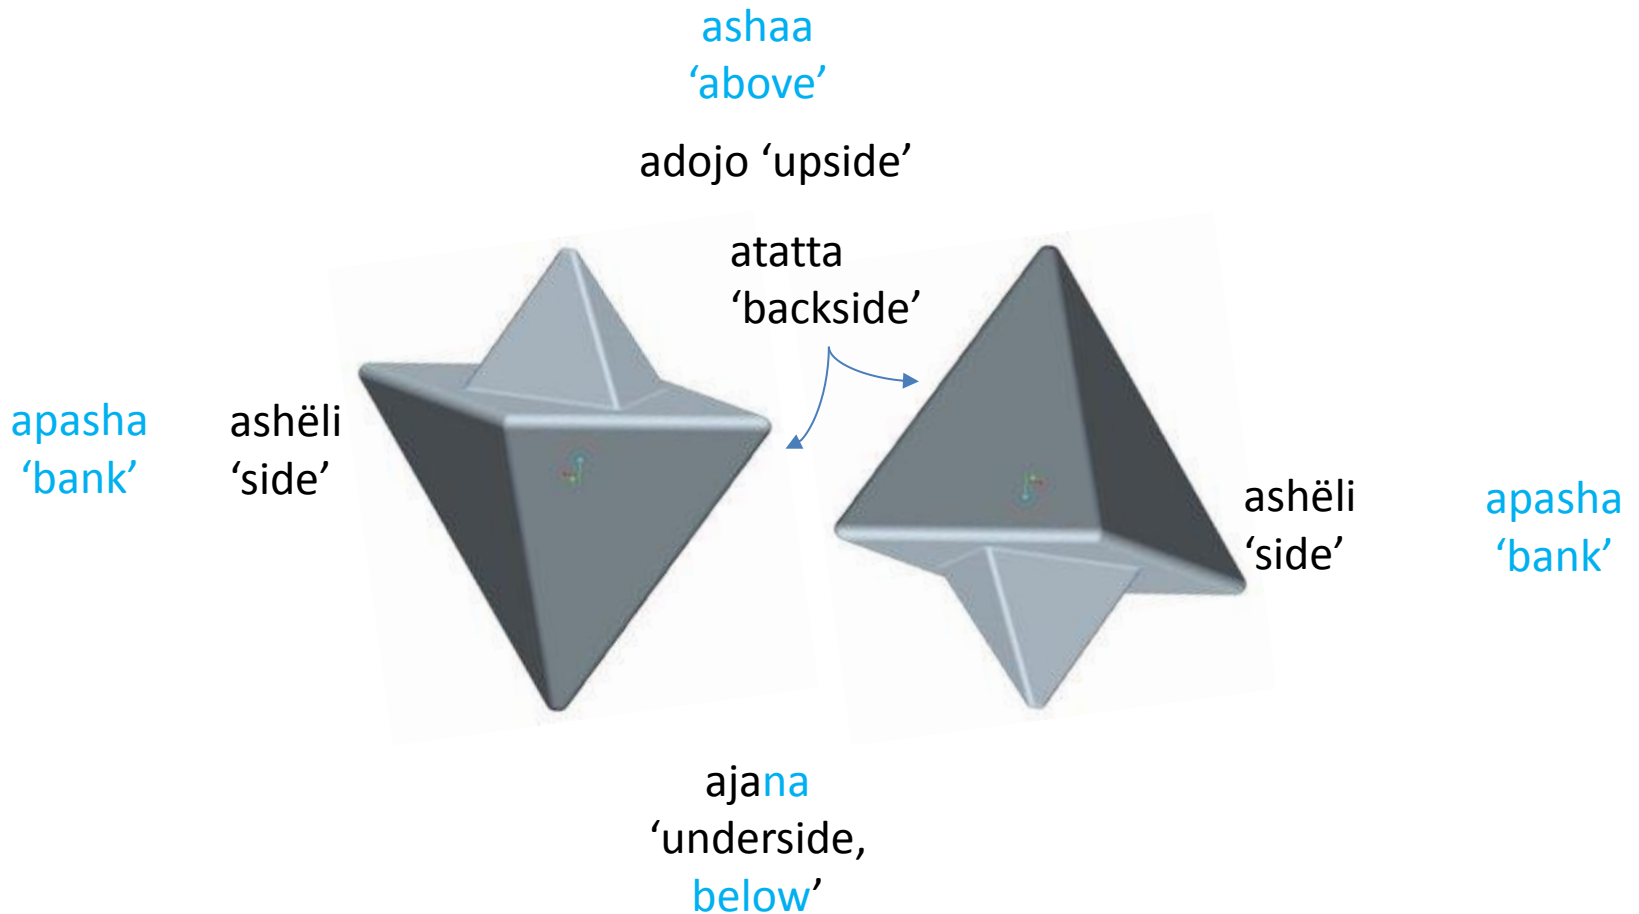

There is a system of dedicated nouns that functions as a 'fixed' frame.

The meronym system seems to operate as a complementary frame.

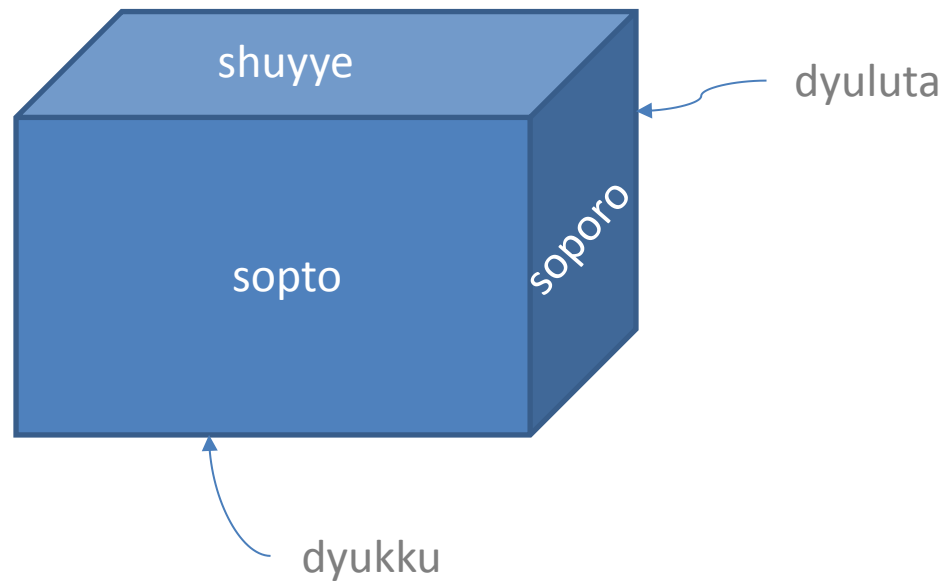

Conclusions

There furthermore seem to be two frames, one for the main body, and one for protrusions.

System 1: dedicated spatial nouns

System 2: main volume meronyms

System 3: secondary volume meronyms
