Even our competitors come to CAChé seminars.
Incognito, of course.

But who'd blame them? If you're looking for answers to questions about computer-aided chemistry, there's no better place to be than a free seminar sponsored by CAChé Scientific. In just a couple of hours you'll gain unique insight into the economics and real-world application of computer-aided chemical development, pioneered and perfected by CAChé.

See how reaction analysis using our computer-aided tools can be applied to your industrial applications, from catalysts and process optimization to pharmaceutical research. We'll highlight examples for estimating reaction thermodynamics, kinetics and pathways.

Recognize this face?

Take a look around the lab. Bet you spot at least one REPIPET® bottle top dispenser. Chances are, it's the first liquid dispenser you used. It's as big a hit today; still reproducible within one tenth of one percent from top to bottom, guaranteed.

You can see why it's popular. In fact, you can see everything. That's glass for you. Great visibility, easy to clean and safe for most liquids.

The Labindustries REPIPET® dispenser family is full of solutions. They all have the face you've grown to love and they're all as close as your nearest dealer.

This multivolume handbook presents the most authoritative and comprehensive reference work on major zoonoses of the world. The Handbook of Zoonoses covers most diseases communicable to humans as well as those diseases common to both animals and humans. It identifies animal diseases that are host specific and reviews the effects of various human diseases on animals. Discussions address diseases that remain important public and animal health problems and the techniques that can control and prevent them.

The chapters are written by internationally recognized scientists in their respective areas of disease, who work or have worked extensively in the most affected areas of the world. The emphasis for each zoonosis is on the epidemiology of the disease, the clinical syndromes and carrier states in infected animals and humans, and the most current methods for diagnosis and approaches to control. For infectious agents or biologic toxins which may be transmitted by foods of animal origin, a strong focus is placed on food safety measures. The etiologic and therapeutic aspects of each disease important to epidemiology and control are identified.

Here’s what’s new in the Second Edition

• Contributions from a panel of highly authoritative authors selected for their extensive experiences and publication records
• Newly emerging zoonoses of major importance
• Comprehensive data on foodborne zoonoses
• Totally updated introductions to each chapter focusing on the major, uncontrolled, and continuing emerging infectious diseases in the world

Abstract

This paper reports on the development of a nose-mechanized interface device that provides real-time gesture, position, smell, and facial expression information. The DATANOE™ prototype DATA Tactile CORNUCOPIA Neumatic Olfactory I/O device Tactile Manipulation [Olsen84, Myers89] allows novice users without any formal nose training to perform complex interactive tasks.

1 Hardware Design

There are many different types of plastic noses sold in novelty stores [Spencer Gifts]. Several different forms were tried: pig nose, elephant nose, rabbit nose, cow nose, mouse nose, duck nose, witch nose, and cat nose. (Figure 1 shows six commonly available alternative nose forms.) Each proved to have serious disadvantages. For example, the pig nose was uncomfortable after several hours of use and the whickers on the mouse nose tended to get caught in printers.

Because of its simplicity, sturdy attachment mechanism, and availability, the Gruncho Marx nose was chosen as our hardware platform. (Note that not all Gruncho noses are the same. Subtle physical variations can cause substantial differences in usability [Baxton86].)

The initial DATANOE™ prototype mounted the nose to a motorcycle helmet (NASA), see Figure 2. After problems with nosebleeds, hay fever and unexplained nausea, we dispensed with the helmet platform and decided to use the traditional sturdy black rimmed glasses that come with the nose.

2 Rhino-Virtual Realities

Early rhino-virtual realities relied on rapid horizontal motion—twisting as the only interaction method [Bewitched]. The addition of modern hardware and software techniques to nose-based virtual realities allows the DATANOE™ to use multiple interaction methods. A Polhemus—comfortably situated inside the
Rhinoplasty

NASAL SURGERY / Rhinoplasty

Corrective nasal surgery is perhaps one of the most common types of cosmetic procedures performed today. The operation is employed for repair of injuries and for those conditions of developmental nature that are essentially familial in origin. Technical refinements in the performance of this operation provide uniformly better results than were possible twenty-five or fifty years ago.

Before proceeding with any discussion of surgical details, it seems appropriate to answer a number of general questions which are posed quite frequently. **At what age is this operation best performed?** The answer relates more to the degree of physical and emotional development than it does to chronological age. There are many youngsters of fifteen or sixteen years who are not quite fully grown physically, but who are emotionally compromised by lack of confidence in their personal appearance. These individuals can be considered good candidates for operation (other factors being equal) even though there may be a limited degree of physical growth still to take place. Delay under these circumstances means sacrificing the essential objective in treatment by giving lesser importance to emotional needs than to the one or two millimeters of physical change that might take place after the surgical procedure. A child of fifteen or sixteen years may, however, be at the same stage of physical development and not at all emotionally prepared for this procedure. In this case, the operation should be deferred until there is more evidence of maturity. Certainly, there will be some youngsters whose entire growth and development are late so that even at
